

(a) Naive pipeline (every prior cyclone-affected SAR rice study)

saline storm-surge inundation is mis-read as transplanting flooding, biasing SOS

SOS bias from saline-surge confound: +5.66 d (synthetic-panel verification, $p_{perm} = 0.018$)

(b) Corrected pipeline (this study)

the saline-flood classifier (Module 02) breaks the storm-surge → trough arrow, restoring identification

Residual SOS bias after correction: +1.96 d ($p_{perm} = 0.054$; corrected/EOS null at $p = 0.27$ — mechanism-specific)
