

(a) Naive pipeline (every prior cyclone-affected SAR rice study)

saline storm-surge inundation is mis-read as transplanting flooding, biasing SOS

SOS bias from saline-surge confound (raw pipeline): +15.29 d (real v2.1 panel, p_WCB = 0.4000)

(b) Corrected pipeline (this study)

the saline-flood classifier (Module 02) breaks the storm-surge → trough arrow, restoring identification

Residual SOS bias after correction: +15.11 d (p_WCB = 0.4065; Δ from raw ≈ 0.18 d, bounded by district pixel share)
